We know how exciting bringing home a new companion is, and we also know that you might have questions or need support along the way. For basic pet care tips, please visit <u>aspca.org/behavior</u> or call us at 636-583-4300.

THE BASICS

Food: Franklin County Humane Society is a proud supporter of Purina. Your cat/kitten has been eating Purina Cat Chow or Purina Kitten Chow (unless otherwise noted). Please ensure to read the bag for instructions on the proper amount of food to feed your new pet.

If you wish to change the brand of food, we recommend that you purchase another nutritious cat food and introduce it gradually by mixing the current food in with the new food. We also recommend providing food only at mealtimes. Leaving food out for your cat to eat whenever they want can lead to obesity and other diseases.

Water: Provide fresh water in a clean bowl daily. Your cat should have access to the water at all times.

Litter Box: Place an appropriately sized, uncovered litter box with approximately 1-2 inches of litter in a quiet but accessible location. If you have a covered litter box, remove the cover for the first week to allow your cat to get used to the new litter box.

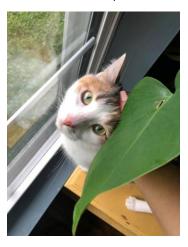

The Honeymoon Stage: Adopting a new family member is exciting, but there will likely be an adjustment period for both you and your new pet. There may be times when you feel overwhelmed and have second thoughts about your adoption. It's important to remember that during the transition period, your cat/kitten may display behaviors that were not discussed at the time of adoption. It's normal and to be expected. It may take time for your new pet to adjust to your routine. If you have any questions about your cat's behavior, we encourage you to keep a journal of the behavior and reach out to us at 636-583-4300 or frontdesk@fchsmo.org if you need support. We are here to help in any way possible!

Tips for a Happy Cat

TAKE IT SLOW

Cats can be easily overwhelmed by new spaces, so when you get home, set your cat up in a small quiet room. Keep the door closed. Be sure your cat has access to comfy bedding, hiding spots, toys, food, water, a scratcher, and a litterbox. Interact with the cat on their terms –sit a few feet away from them and let them approach you for petting or attention. When the cat is moving around this space confidently, you can begin to slowly introduce them to the rest of your home. Some cats will settle in within a few hours, but most will need a few days or more.

LITTER BOX

Most cats do best with large, uncovered litter boxes. For kittens or senior cats, be sure the box has lower sides for easy access. Most cats prefer about 1"-2" of unscented litter in the box. Place the box in a quiet area. Cats are more likely to consistently use the litter box when it is kept clean. We recommend you scoop twice a day and perform a full clean every two weeks. Use mild dish soap or a pet-friendly enzymatic cleaner (avoid bleach and other harsh chemicals). It is recommended to have one large size litter box per cat in the home. If you have a multi-story home, you may need to have a litter box on each story.

MAKE CARRIERS HAPPY PLACES

Getting your new cat used to the carrier means vet visits and travel will be much easier-and it's super easy to do! Just set the carrier up in a spot where your cat likes to hang out and keep it out all the time. Prop the door open, place some comfy bedding inside, and feed a treat or canned food in the carrier at least once a day. If your cat rests in their carrier regularly, mission accomplished!

SCRATCHING SURFACES

Cats have a need to scratch, so be sure to provide plenty of cat-friendly scratching surfaces. Most cats enjoy both horizontal cardboard scratchers and upright scratching posts (for posts, pick one that is sturdy and tall enough for your cat to get a good stretch). Reward your cat with treats and praise when they use their scratchers.

DAILY INTERACTIVE PLAYTIME

Playing with your cat is a great way for you to bond and help them feel less stressed. Cats love chasing, pouncing on, and leaping after wand toys. Keep play interesting by having a couple of different wand toys on daily rotation. When using wand toys, allow your cat to "catch" the toy a few times during play and end playtime with a yummy

treat. A good play session can last from 10 to 15 minutes. Always use toys during play, and not your hands or feet. If your cat tries to play with hands or feet, become a statue by folding your arms and looking away and wait a few minutes before giving any more attention. Cats love to climb and perch, so give them access to higher areas with a cat tree or places in your home for them to jump on.

FELINE DIY ENRICHMENT

Enrichment is essential for cats and kittens of all ages and keeping your cat's environment as exciting and stimulating as possible will promote a happy and healthy life. Check out these great <u>DIY projects</u> that will keep you and your cat entertained. These resources include food and environmental enrichment guides to help you make your own fun and affordable cat toys.

Introducing Your Cat to a New Cat

If you're bringing a new cat into your home, the most important thing is to be patient. The introduction between two cats must be gradual and keep in mind it can take a long time for a relationship to grow. The first impression a new cat makes when they meet your resident cat is critical. If two cats display aggression during their first meeting, this may set the mood for their future relationship.

If your resident cat becomes aggressive when they see other cats outside your home, you'll probably have a difficult time introducing a new cat into your household. If your cat has lived harmoniously with other cats in the past, the odds are good that they will adjust to a newcomer. However, it is generally not possible to predict whether any two individual cats will get along.

To set them up for success, be patient and follow these steps:

STEP 1: KEEP THE CATS SEPARATED

Just before you bring your new cat home, confine your resident cat to one room so the cats are unable to see each other. Do not give your resident cat an opportunity to approach the new cat in their carrier. This can be extremely frightening for the new cat.

Bring your new cat directly into their own quiet room. Be sure the door to this room stays closed. This will allow the two cats to smell and hear—but not see or touch—each other. This helps reduce stress by not overwhelming either cat with too much change too quickly.

Each cat should have essential items within their respective spaces: food, water bowl, litter box, scratching post, and places to hide (cardboard boxes make for easy and inexpensive hiding spots). Do your best to avoid changing your resident cat's environment and routine as much as possible: keep the same feeding schedule, avoid moving resources such as litter boxes or scratching posts, and give them plenty of your attention.

During this period of separation, teach the cats to associate each other's scent with positive experiences:

- Feed the cats treats near the door that separates them so they learn that coming together (even though they can't see each other) results in a pleasant experience.
- Offer each cat something that smells like the other cat, such as bedding or a towel rubbed on each cat's head and cheeks. Place a treat on the bed or towel to help the cats make a positive association with the other cat's smell.
- Play with each of the cats near the door. Encourage them to paw at toys under the door. Eventually the cats may play "paws" under the door with each other.
- If your resident cat is not showing signs of stress and your new cat is exploring confidently, eating well, and using the litter box, switch the cats' locations so they can investigate each other's smell. This also allows your new cat to explore a different section of your home.

Introducing Your Cat to a New Cat

STEP 2: LET THE CATS SEE EACH OTHER

Only move onto this step if there are no signs of aggression (hissing, growling), both cats are eating well, using their litter box, and otherwise not showing any signs of illness or stress. Remember to take it slow! You are helping the cats to build a relationship that will continue to develop over time; there is no need to rush them--different cats go at different paces.

Before you start, decide if you will use a baby gate for this step or just crack the door open slightly. Your goal is to allow the cats to see each other, but not interact. If you use a gate, be sure it is securely in place before opening the door. Use this method with caution because a cat can easily jump over even a tall gate.

• If possible, have a friend or family member help, where one cat and one person are on each side of the door. Give each cat a play session followed by a meal before you start.

- Allow the cats to see each other. When either cat notices the other, offer that cat a tasty treat or play with a favorite toy. Do not force the cats to come closer to one another. It is important that the introduction goes at their pace.
- Avoid petting or holding either cat during these sessions. Being petted or handled can inadvertently cause stress and they could accidentally scratch you.
- Let the cats see each other for just a few minutes and end each session while both cats are still relaxed. Continue to keep the cats fully separated between these sessions.
- Over the next few days, continue to feed meals, offer treats, and play with the cats near the barrier. Gradually lengthen the amount of time the cats see each other.

STEP 3: LET THE CATS SPEND TIME TOGETHER

Hold off on this step until the cats are completely relaxed during step 2 and show no signs of conflict or aggression. Supervise these initial face-to-face interactions carefully and keep the interactions short at first.

- It is a good idea to play with each cat while they can see each other behind the barrier, feed them a meal, and then remove the barrier. This is so that both cats are feeling calm when they spend time together.
- Start with just a few minutes at a time, gradually increasing the time they spend together over several sessions. Carefully observe both cats for signs of stress and do not force them to approach each other.
- As the cats become more comfortable with each other, allow them longer and longer periods of time together.
- Keep a large towel handy just in case the cats begin to fight. If they do fight, do not touch them! Use the towel to block them from seeing one another, then lure them away from each other. Go back to step 2 for about another week, then try removing the barrier again.

ADDITIONAL TIPS FOR KEEPING THE PEACE IN A MULTI-CAT HOUSEHOLD

- Your cats will be more likely to get along if they're happy in their environment. Look at the layout of your home. Make sure there are always plenty of hiding spots for your cats. Some like to sit up high, on shelves or perches, while others tend to hide under and behind things, so make sure you provide hiding spots at floor level as well.
- Offer at least the same number of litter boxes as there are cats, but ideally one more (so if you have three cats, offer them all access to at least three litterboxes, but four is better). The litter boxes should be located in different areas of the home as instead of side by side.
- Offer multiple scratching posts, resting/hiding spots, water bowls, feeding stations, and perches in different locations. When cats must compete for resources, it can increase the potential for conflict. It is especially important that food, water, and litter boxes are placed out in the open so your cats don't feel trapped or vulnerable when they access these resources.
- In addition to a well-designed home environment with plenty of access to resources, consider using a pheromone therapy called Feliway Multi-Cat. Available as a diffuser or spray, this product is a copy of the feline appeasing pheromone mother cats produce during lactation and can provide a calming effect among the cats in your home.
- If you're bringing a new cat into a household with multiple cats, introduce each resident cat to the newcomer individually. After each of your cats has met the new cat one-on-one and absent any signs of stress or aggression, you can start to allow all the cats to mingle as a group.
- When returning from a vet visit, even if just one of your cats went to the vet, it is always a good idea to keep the cats in separate rooms for at least a day. Smell is a key form of communication for cats and the smell of the vet's office can be interpreted as threatening.
- If one cat spends most of their time hiding or one cat continuously bullies the other cat, reach out for help (see below for our contact information or look for a certified professional). These types of interactions can cause other behavioral issues, such as litter box accidents, and the longer these behaviors happen, the harder they can be to fix.

ASK FOR HELP

If you need support, contact us at 636-583-4300 or frontdesk@fchsmo.org

We understand taking a pet home can come with unexpected challenges, and we are here to support you. If you feel like you need more in-depth guidance, we suggest seeking out the support of a certified professional.

The Truth behind Declawing

What is declawing?

How does declawing harm my cat?

> Declawing can cause nerve damage, phantom pain, pain from bone fragments left behind or arthritis, and pain-related behavior issues like biting and avoiding the litter box. For these reasons and more, a growing number of veterinary organizations oppose declawing.

Why do cats scratch?

• Scratching is normal cat behavior; it helps your cat stretch, remove dead husks from their claws and add their scent to their surroundings.

How can I protect my furniture?

To protect home furnishings, give your cat alternative places to scratch. Use positive reinforcement training to teach your cat where they can scratch. While your cat is learning, cover furniture with a tight-fitting sheet or use double-sided sticky tape on the places your cat tends to scratch.

- Offer tall, sturdy scratching posts and pads from different materials like carpet, sisal, wood and cardboard.
- Place multiple scratching posts around your home and near the furniture you don't want scratched.
- Try both vertical posts and horizontal or angled boards to learn your cat's preference.

How can I stop my cat from scratching people?

If your cat intentionally scratches people out of fear or aggression, consult a trainer or behaviorist for guidance on behavior modification using positive reinforcement. To prevent accidental scratches, keep your cat's claws trimmed and ask your veterinarian about soft plastic nail caps

We strongly urge our adopters to think fully and do their own research about the effects of getting a cat declawed.

The Benefits of Inside Living

Many new pet owners struggle with this decision, but the truth is that keeping your cat indoors is the safest option for family and feline. In fact, what many pet owners don't realize are the risks that come from allowing their pets to roam outside:

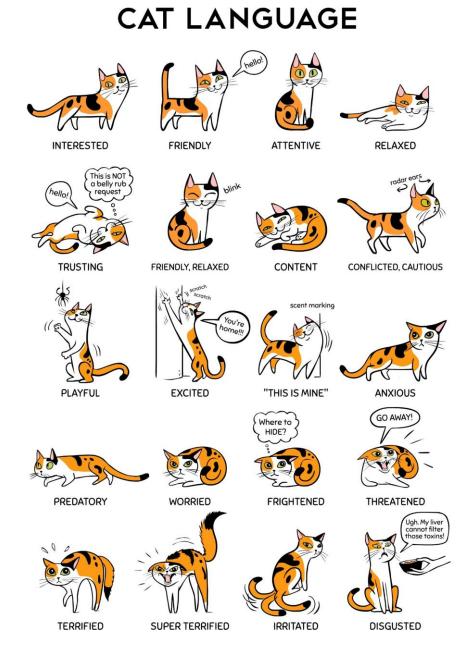

- Fights with other cats
- Attacks by free-roaming dogs
- Infections from puncture wounds
- Gunshot wounds
- Fleas, ticks, worms
- Pesticide poisoning
- Feline Leukemia
- Feline Immunodeficiency Virus (FIV)
- Being hit by a car
- Encounters with sick and possibly rabid animals
- Being sprayed by skunks
- Being stolen
- Steel jaw traps
- Sickness or death from eating spoiled foods or poison

If you are looking to adopt a cat that would thrive outdoors, please ask about the available cats in our working cat program!

What to Expect Owning an FIV+ Cat

Cats with FIV have a virus which leads to a compromised immune system, so it is strongly recommended that FIV+ cats remain as indoor cats only. This helps to prevent their exposure to other viruses carried by wild cats, and reduces the chance that they may get into an accident that they will have a hard time recovering from. They should have clean, regulated environments much the same as any other cat.

While most cats go to the vet once a year, it is usually a good idea to make more frequent visits to your vet when owning an FIV+ cat. The American Association of Feline Practitioners (AAFP) recommends checkups at least twice a year. If you notice your FIV cat is acting under the weather, do not hesitate to take them for a checkup. Cats do not pass away from FIV, but if there is an underlying viral or bacterial infection, their body has a difficult time mounting a defense. A lot of FIV+ cats do not begin to show symptoms of a weakened immune system until late in life when many cats' immune systems naturally begin to slow down.

We now know considerably more about FIV and the AAFP does not suggest euthanasia for FIV+ cats. As an owner of an FIV+ cat, you may have to find a veterinarian who has some experience with FIV and keeps up on recent research and best practices.

Living with Other Animals

FIV+ cats can live freely with other non-feline animals (dogs, ferrets, etc.) without the fear of transmission as FIV is a feline-specific virus. If other cats are present in the home, several options exist for the patient adopter. FIV is only spread through mating or deep bite wounds – something uncommon in spayed/neutered animals that are kept indoors. By properly and patiently introducing the cats and monitoring their interactions, FIV+ cats can safely live alongside other healthy cats. There is also a vaccine available for FIV+ but it is still controversial and should be discussed with a vet before administering.

FAQ's about FIV

What is FIV? – FIV is the acronym for Feline Immunodeficiency Virus, a cat-specific lentivirus that targets the white blood cells of a cat.

How is FIV spread? – FIV is spread only through deep bite wounds from an infected cat, mating, or passed on genetically from mother to kittens. It is most often seen in unaltered, roaming male cats that enter into territory conflict with other males.

Can it infect me or my other pets? – FIV is specific to felines, and cannot affect other species of animals. It can be spread, however, to other cats through mating or bite wounds (uncommon even with disgruntled cohabitants). It is not passed casually, as with Feline Leukemia. Transmission is uncommon in altered, inside felines.

How long do FIV+ cats typically live? – FIV has not been proven to cause a direct drop in life expectancy, and FIV+ cats often live the standard lifespan for cats kept indoors, 15-18 years of age. With regular vet visits, it is not uncommon to have these cats live long and happy lives!

What are the symptoms of FIV? – When the cat is first infected, it may run a fever or have swollen lymph nodes. Following that, cats may not show any symptoms of a suppressed immune system for weeks, months, or years. In its most advanced stage, cats become more susceptible to outside forms of infection and disease. That is why it is important to have your cat seen by the vet if he or she is showing early signs of illness.

What are common health concerns for FIV+ Cats? – As well as their increased risk of fighting off viral infections, FIV+ cats are prone to common infections in the skin (often in patches of itchy missing hair), periodontal disease or gum inflammation, diarrhea, and urinary tract infections. These areas should receive attention on your regular veterinary checkups, and be counteracted with a good diet and supportive supplements.

Is there a vaccine? – There is currently an FIV vaccine in use in the US. There is often controversy surrounding it, so always consult a veterinarian before vaccinating any household cats.

Why should I adopt an FIV+ Cat? – Adopting an FIV+ Cat can be a wonderful opportunity to give an otherwise down-and-out cat a chance at living in a loving home. FIV+ Cats need their owners' love and attentiveness to ensure they live a long and healthy life. In some cases, FIV+ cats outlive regular cats, due to their regular trips to the vet, usually identifying issues long before they become a problem!
